Definitions

Business Intelligence Defined

Business intelligence (BI) is “knowledge gained through the access and analysis of business information.” Business intelligence tools and technologies include query and reporting, online analytical processing (OLAP), data mining and advanced analytics, end-user tools for ad hoc query and analysis, and dashboards for performance monitoring.

Definition source: Howard Dresner, *The Performance Management Revolution: Business Results Through Insight and Action* (John Wiley & Sons, 2007)

Agentic AI Defined

Agentic AI solutions deliver measurable business outcomes by wrapping together three foundational components: a clearly defined business process, a large language model (LLM), and access to relevant, cloud-hosted data. These components work together to enable intelligent task execution—automating actions, making decisions, and adapting in real time with minimal human intervention. The business process at the core of each solution can take the form of a structured, rule-based workflow or a more adaptive business script, depending on the nature of the task. Workflows are ideal for repeatable, high-precision operations, while scripts offer flexibility for more variable or context-sensitive activities.

Introduction

On behalf of Dresner Advisory Services, I'm pleased to present the inaugural edition of our Agentic AI Report.

At Dresner Advisory Services, we're committed to providing data-driven, independent, and objective research that helps our community make informed decisions in the face of rapid change. This report continues that mission, offering clear insights into adoption patterns, success factors, and the organizational characteristics that correlate with early returns from agentic AI initiatives.

In less than a year, agentic AI has moved from concept to business priority. By early 2025, vendors began releasing solutions, and adoption is accelerating: 10.5% of the organizations we surveyed are actively experimenting or deploying, with another 27% poised to follow. While 58% remain cautious, momentum is building. As early adopters show results, we expect broader adoption across the majority will follow.

As we continue to grow and evolve, we extend our sincere appreciation to our clients and community for their support over the past 18 years. Your participation and engagement have been instrumental in shaping our research and driving its relevance and impact.

We invite you to explore the findings and consider where your organization stands—and where it might lead—as this next phase of intelligent automation unfolds.

Thank you for your continued trust in our work.

Benefits of the Study

The 2025 Dresner Advisory Services Agentic AI Report provides a wealth of information and analysis to both consumers and producers of business intelligence technology and services. Our study delivers valuable insights into the market landscape, vendor evaluation, technology trends, use case examples, and industry-specific insights. These insights help organizations make informed decisions as they seek to maximize value generation from data and analytics assets through procurement and implementation of a data catalog or by upgrading, augmenting, or replacing their existing data catalog.

Consumer Guide

As an objective source of industry research, the Dresner Advisory Services Agentic AI Report helps consumers to understand how their peers leverage and invest in agentic AI and related technologies.

From our unique vendor performance measurement system, users glean key insights into agentic AI vendors, which enables:

- Comparisons of vendor performance to industry norms
- Identification and selection of new vendors

Supplier Tool

Vendor licensees use the Dresner Advisory Services Agentic AI Report in several important ways:

- External Awareness
 - Build awareness for the technology market as well as supplier brands—citing Dresner Advisory Services Agentic AI Report trends and vendor performance
 - Gain lead and demand generation for supplier offerings through association with Dresner Advisory Services Agentic AI Report brand, findings, webinars, etc.
- Internal Planning
 - Refine internal product plans and align with market priorities and realities as identified in the Dresner Advisory Services Agentic AI Report
 - Better understand customer priorities, concerns, and issues
 - Identify competitive pressures and opportunities

About Howard Dresner and Dresner Advisory Services

The Dresner Advisory Services Agentic AI Report was conceived, designed, and executed by Dresner Advisory Services, LLC—an independent advisory firm—and Howard Dresner, its president, founder and chief research officer.

Howard Dresner is one of the foremost thought leaders in business intelligence and performance management, having coined the term “business intelligence” in 1989. He

has published two books on the subject, *The Performance Management Revolution – Business Results through Insight and Action* (John Wiley & Sons, Nov. 2007) and *Profiles in Performance – Business Intelligence Journeys and the Roadmap for Change* (John Wiley & Sons, Nov. 2009). He lectures at forums around the world and is often cited by the business and trade press.

Prior to Dresner Advisory Services, Howard served as chief strategy officer at Hyperion Solutions and was a research fellow at Gartner, where he led its business intelligence research practice for 13 years.

Through the Wisdom of Crowds® market research reports, we engage with a global community to redefine how research is created and shared. Other research reports include:

- Wisdom of Crowds® Flagship BI Market Study
- AI, Data Science, and Machine Learning
- Active Data Architecture®
- Analytical Data Infrastructure
- Analytical Platforms
- Data Engineering
- Embedded Business Intelligence
- Generative AI
- Guided Analytics®
- Master Data Management
- ModelOps
- Semantic Layer

You can find more information about Dresner Advisory Services at www.dresneradvisory.com

About Myles Suer

Myles Suer is a research director at Dresner Advisory Services. He is also a technology journalist, and is the #1 CIO influencer, according to LeadTail. He facilitates the #CIOChat, connecting CIOs and senior leaders across industries worldwide. Recognized as a top 100 digital influencer, his thought leadership is featured in ComputerWorld, CIO Magazine, Cutter Business Technology Journal, Datamation, eWeek, CMSWire, and VKTR.

Suer's career spans startups and major tech organizations, including Alation, Privacera, Informatica, HP, and Peregrine. At Informatica, he led product marketing for the Intelligent Data Platform. At HP and Peregrine, he directed product teams that applied analytics and AI to IT management, creating innovations like the CIO Scorecard and AI-driven service ticket optimization.

In addition to his professional accomplishments, Suer is a prolific reviewer of books on AI, technology, and strategy for leading publishers such as Harvard Business Review Press, MIT Press, and Columbia University Press. He holds a masters of science degree from UC Irvine and a second masters degree in business in strategic planning from the University of Southern California.

The Dresner Team

About Elizabeth Espinoza

Elizabeth is director of analytics at Dresner Advisory and is responsible for the data preparation, analysis, and creation of charts for Dresner Advisory reports.

About Sherry Fairchok

Sherry is senior editor at Dresner Advisory, ensuring the quality and consistency of all research publications.

About Danielle Guinebertiere

Danielle is vice president of client services at Dresner Advisory. She supports the ongoing research process through her work with executives at companies included in Dresner market reports.

About Michelle Whitson-Lorenzi

Michelle is director of research operations and is responsible for managing software company survey activity and our internal market research data.

Survey Method and Data Collection

As with all our Wisdom of Crowds® market studies, we constructed a survey instrument to collect data and used social media and crowdsourcing techniques to recruit participants.

Data Quality

We carefully scrutinized and verified all respondent entries to ensure that only qualified participants were included in the study.

Executive Summary

Executive Summary

- Agentic AI emerged as a distinct category in late 2024 and has quickly captured the attention of the software industry. What began as experimental innovation is now a strategic priority, prompting broad-based investment across the market.
- Already, 68.5% of software providers have introduced agentic AI capabilities—a striking level of adoption that reflects both opportunity and competitive urgency.
- This wave of activity is reshaping the industry. Traditional development cycles are being disrupted, and vendors are rethinking platform strategies to incorporate more autonomous and intelligent behaviors.
- Boundaries between categories such as business intelligence, automation, integration, and analytics are dissolving. Agentic AI spans these silos, prompting organizations to reconsider how they evaluate and procure technology.
- This convergence is creating a more fluid application landscape and forcing many providers to redefine their value propositions. As capabilities overlap, clarity of differentiation becomes more challenging.
- Market consolidation appears likely. Competitive pressure and the need to scale may drive mergers and acquisitions, while some vendors may struggle to adapt and survive.
- Startup activity is intense. New entrants are racing to establish visibility and credibility, positioning themselves as key enablers of agentic AI capabilities.
- The level of outreach from early-stage firms reflects a high degree of urgency and a desire to break through before the market matures.
- From the customer perspective, interest in agentic AI is exceptionally high—and increasingly action-oriented. Organizations are moving from exploration to real deployments, seeking practical outcomes.
- Buyers see agentic AI as a lever for improved productivity, faster decisions, and systems that can adapt dynamically to goals and context.
- Agentic AI is already reshaping how software is designed, delivered, and adopted. Its influence will only grow as its capabilities mature and business use expands.

Study Demographics

Study Demographics

Study participants provide a cross-section of data across geographies, functions, organization sizes, and vertical industries. We believe that this supports a more representative sample and is a better indicator of true market dynamics. We constructed crosstab analyses using these demographics to identify and illustrate important industry trends.

Geography

North America, which includes the United States, Canada, and Puerto Rico, represented the largest group of survey respondents, with just under 65% of all respondents, followed by Asia Pacific with 18%, EMEA with 12%, and Latin America with 5% (fig. 1).

Figure 1 – Geographies represented

Functions

In 2025, information technology (IT) respondents continued to account for the largest portion of our survey sample (35%; fig 2.). Those roles represented in the survey at levels greater than 10% were finance (22%), Business Intelligence/Analytics Competency Center (BICC; 14%), executive management (11%), and research and development (R&D; 8%). Other roles represented in the survey participated at rates well under 5%.

The roles with the highest levels of survey participation are those historically associated with greater need for data and analytic requirements. Executive management and finance tend to have broader data and analytic governance requirements than most, generating greater interest in governance capabilities.

Figure 2 – Functions represented

Vertical Industries

In 2025, technology respondents (23%) led vertical industries represented in the sample, followed by several groupings: manufacturing and business services (18%), financial services and healthcare (10%), and consumer services, education, and retail & wholesale (around 5%; fig. 3).

Figure 3 – Vertical industries represented

Organization Size

Our 2025 survey included small organizations (1-100 employees), midsize organizations (101-1,000 employees), and large organizations (more than 10,000 employees; fig. 4). Similar to last year, midsize organizations comprised the largest category of respondents, at 33%. As a group, smaller organizations account for just over 48% of respondents. Large organizations comprised 19% of respondents.

High-quality, high-integrity, trusted data and analytic content is important to every organization, regardless of size.

Figure 4 – Organization sizes represented

Company Age

In 2025, companies in business for 16 or more years accounted for a majority of respondents, at 62% (fig. 5). Companies five to 16 years old comprised 29% of respondents (15% for companies five to 10 years old and 14.4% for those 11-16 years old, respectively) while companies less than five years old accounted for 8%.

Figure 5 – Company ages represented

Analysis & Trends

Analysis and Trends

Relative Importance of Agentic AI in Technologies and Initiatives

Every year, Dresner Advisory asks survey respondents to stack rank the technologies/initiatives we consider strategic to BI. In 2025, agentic AI analytics ranked 44th among the 65 tracked (fig. 6). This is the first time agentic has AI appeared in our surveys as a key BI-related technology, which in part explains its lower positioning. Most newer technologies “enter” the chart at lower levels. Agentic AI’s level indicates decent general awareness but overall immaturity, especially related to significant levels of production use.

Technologies and Initiatives Strategic to Business Intelligence

Figure 6 – Technologies and initiatives strategic to business intelligence

Outlook for Agentic AI

First introduced by Andrew Ng in March 2024, agentic AI has quickly become one of the most significant emerging trends in artificial intelligence. Ng specifically highlighted the power of agentic workflows—where large language models (LLMs) are embedded into autonomous processes that can act, decide, and adapt with minimal human oversight. This marked a shift from viewing LLMs as simple tools to positioning them as intelligent agents capable of driving business workflows from end to end.

In less than a year, agentic AI has moved from concept to business priority (fig. 7). By early 2025, vendors began releasing solutions, and adoption is accelerating: 10.5% of organizations are actively experimenting or deploying, with another 27% poised to follow. While 58% remain cautious, momentum is building. As early adopters show results, we expect broader adoption across the majority will follow.

Figure 7 - Outlook on agentic AI

It's always revealing to observe variations in how a technology inflection point is perceived—and acted on—across global regions. The rise of agentic AI offers a clear case in point, with geographic disparities that highlight both opportunities and challenges in global adoption (fig. 8).

Adoption in EMEA is trailing, with only 5% of organizations actively pursuing agentic AI—half the global average. This may reflect regulatory caution, conservative automation practices, or delayed investment. Many organizations may be awaiting European Union regulatory guidance. By contrast, 11% of organizations in Asia Pacific and North America are active adopters, aligning with the global average for early deployment.

Outlook on Agentic AI by Geography

Figure 8 - Outlook on agentic AI by geography

Perhaps most surprising are our survey responses from Latin America, where 18% of organizations already identify as proponents and early adopters—67% higher than the global average. This signals a bold openness to innovation within the region, likely driven by a desire to leapfrog legacy systems and rapidly improve productivity through AI-powered automation. The same interesting development was seen in this year's genAI report. Such regional variation underscores the importance of local context and enterprise readiness when planning for agentic AI.

Risk tolerance and openness to disruptive innovation differ significantly across organizational departments, with adoption rates revealing building momentum. Sales and marketing leads the way, consistent with its tendency to embrace emerging technologies to drive growth and customer engagement. In 2025, 19% of these professionals are proponents and active adopters, with another 33% expressing excitement and plans for early adoption. This alignment with past research confirms their role as early movers, particularly in leveraging AI.

Outlook on Agentic AI by Function

Figure 9 - Outlook on agentic AI by function

R&D joins sales and marketing as the only functions in which a majority of respondents are active or early adopters, at 52% and 56%, respectively. BICC and IT—functions often tasked with integrating innovation into organizational infrastructure and insight generation—next most often indicate the same two perceptions (47% and 40%, respectively). Meanwhile, finance and operations remain more cautious. While their current adoption levels are modest, their long-term potential to benefit from transformative technologies is substantial, suggesting a likely shift as proven use cases emerge and risks become more manageable.

Across industries, two strategic imperatives tend to shape the adoption of disruptive technologies: the industrialization of data and the pursuit of competitive advantage. Business services firms—particularly consultancies—are natural early adopters. As data-centric organizations, they rely on cutting-edge technologies not only to enhance

internal decision making but also to improve client outcomes. Currently, 15% of these firms are active adopters or strong proponents of innovation, when including those who are excited and planning early adoption, that figure rises to 33%. For them, early adoption is not just operationally beneficial—it's a differentiator in a competitive, knowledge-driven market.

Figure 10 - Outlook on agentic AI by industry

Technology firms are leading the way, with 51% of respondents identifying as early adopters or actively exploring agentic AI. These companies are leveraging the technology to accelerate engineering, improve customer success, and drive innovation across their product lines.

Business services firms are close behind, with 33% either adopting or actively exploring agentic AI. As data-driven organizations focused on operational efficiency and insight

generation, they are using early experimentation to strengthen both their internal capabilities and client-facing services.

Financial services and retail, while still in the early stages, are positioned for rapid adoption. Agentic AI presents a compelling business case—streamlining operations, reducing costs, and enhancing customer experiences. As these sectors refine their data strategies and modernize infrastructure, adoption is expected to scale quickly.

Although company size often also represents a proxy for organizational maturity, in the case of agentic AI adoption, the relationship is more nuanced. The data shows that smaller companies report the highest levels of excitement, with 40% indicating enthusiasm about the potential of agentic AI (fig. 11). This makes sense—smaller firms often have less bureaucracy, fewer (if any) legacy systems, more agile cultures, and a higher tolerance for experimentation. Their excitement reflects a desire to leapfrog competitors by embracing cutting-edge innovation early.

Outlook on Agentic AI by Organization Size

Figure 11 - Outlook on agentic AI by organization size

In contrast, the highest proportion of firms actively adopting agentic AI—those which are not just excited but are proponents of putting it into practice—are among the largest enterprises, particularly those in the Fortune 500 and above. Here, 16% report active adoption. These organizations have the scale, resources, and talent to operationalize new technologies at enterprise levels. However, their overall enthusiasm (when factoring in both “excited” and “proponents”) trails off slightly compared to smaller firms, which is not unexpected, given the complexities of implementing new technologies at scale.

The broader context helps explain this pattern. According to research by MIT CISR (*Future Ready*, Harvard Business Review Press, 2022), only 22% of large firms are considered “future ready,” meaning they have successfully industrialized their data and processes and transformed their customer experience. A full 51% remain stuck in

silos—both organizationally and technologically. This suggests that while large enterprises may have the resources to adopt agentic AI, only a limited subset are actually positioned to do so effectively. The implication is clear: The opportunity is real, but the pool of companies ready to seize it remains relatively constrained.

Newer companies consistently demonstrate a greater willingness to embrace disruptive innovations, and the adoption of agentic AI is no exception. Among the youngest organizations, 18% identify as proponents actively adopting this technology, and when including those excited about its potential, the total rises to a notable 51%.

Organizations in existence for five to 10 years show similar enthusiasm, with 53% being active or early adopters. This underscores a pattern: Younger organizations, less burdened by legacy systems and bureaucratic inertia, are better positioned to quickly evaluate and integrate emerging capabilities like agentic AI.

Organizations in existence for 11-16 years also show strong momentum, with the second-highest level of active adoption. In contrast, the oldest organizations appear more restrained. Likely hindered by technical debt, entrenched silos, and complex architectures, their outlook tends to be much more cautious, reflecting the real-world barriers to change at scale.

Outlook on Agentic AI by Company Age

Figure 12 - Outlook on agentic AI by company age

It comes as no surprise that organizations struggling with BI implementations are also the least likely to be active proponents or early adopters of related technologies. In contrast, among those that have achieved complete success with BI, 13.6% are not only proponents but are actively implementing, and an additional 37% report being excited and positioning themselves as early adopters. These organizations have clearly laid the necessary groundwork, enabling them to embrace new capabilities with confidence and speed.

This reinforces the idea that BI success—essentially the industrialization of data—is a foundational prerequisite for innovation. As Thomas Davenport and Nitin Mittal emphasize in *All In on AI*, “every organization that’s serious about AI must deal with its data at some point, structuring and rearchitecting it, putting it on a common platform, and addressing pesky issues like data quality, duplicated data, and siloed data

throughout the enterprise.” The organizations that have overcome these barriers are well positioned to capitalize on AI and analytics-driven opportunities, gaining a competitive edge over peers still mired in data chaos.

Outlook on Agentic AI by Success with BI

Figure 13 - Outlook on agentic AI by success with BI

Not unexpectedly, organizations increasing their investment in BI report the highest levels of active adoption. Among these companies, 12% identify as both proponents and actively adopting agentic AI technologies. This aligns with common patterns of innovation adoption—greater funding often enables more experimentation, faster deployment, and organizational readiness for change.

What is surprising, however, is the behavior of organizations with decreasing budgets. Despite tightening financial conditions, these organizations are among the most enthusiastic early adopters of agentic AI. They not only report high levels of excitement but also rank significantly in the category of proponents and active adopters. This raises

important questions: Has agentic AI gained sufficient management visibility to transcend budget constraints? Or are these teams simply finding compelling use cases that demonstrate immediate business value?

Outlook on Agentic AI by BI Budget Plans

Figure 14 - Outlook on agentic AI by BI budget plans

The reasons for reduced budgets may offer part of the explanation. Many organizations cite improving business profitability, responding to economic pressures, and optimizing for future growth as drivers of cost reduction. Agentic AI, with its promise of productivity gains, intelligent automation, and enhanced decision making, aligns well with these strategic imperatives. In other words, even in times of austerity, agentic AI may be seen not as a cost, but as an essential enabler of future efficiency and competitiveness.

Only time will tell whether this early enthusiasm translates into sustained impact. But what is clear now is that agentic AI is resonating across a broad spectrum of

organizations—both those accelerating their investments and those seeking to do more with less.

Chief data officers (CDOs) and chief information officers (CIOs) play a pivotal role in driving the adoption of agentic AI and broader data-driven initiatives. Many CDOs, in particular, were brought into their organizations with a clear mandate: to transform the enterprise through data and unlock its value. The data confirms the critical influence of leadership—organizations with established data leadership report significantly higher levels of agentic AI adoption readiness, with 18% identifying as proponents and actively adopting, and an additional 34% excited about the possibilities and prepared to be early adopters. These figures stand in stark contrast to organizations with no data leadership or only plans to implement such leadership, highlighting the outsized impact that strong, strategic leadership has in advancing AI and data initiatives. It reinforces the idea that leadership isn't just guiding the ship—it's also making the business case and securing the momentum needed for successful transformation.

Outlook on Agentic AI by Data Leadership

Figure 15 - Outlook on agentic AI by data leadership

The foundational technologies enabling agentic AI—including machine learning and neural networks—are not new concepts but rather well-established capabilities that some organizations have explored and adopted for years. Dresner Advisory Services has long tracked trends in data science and machine learning, and this historical context helps explain current adoption patterns. Among organizations already leveraging data science and machine learning, 24% are proponents and actively adopting agentic AI, with another 37% excited about its potential and preparing to be early adopters. As expected, these rates decline steadily among organizations with limited or no current use of these technologies. This clear gradient underscores the importance of a strong data science foundation as a prerequisite for successfully embracing agentic AI.

Outlook on Agentic AI by DSML Adoption

Figure 16 - Outlook on agentic AI by DSML adoption

While not entirely unexpected, success with self-service BI and adoption of agentic AI show a high degree of correlation. Organizations that consider their self-service BI efforts very successful show notably high levels of intent to adopt agentic AI: 26% identify as proponents and actively adopting, and 35% are excited about its potential and poised to be early adopters. In contrast, adoption rates drop sharply among those with only moderate or limited success in self-service BI. Interestingly, even organizations that have been unsuccessful in their self-service efforts appear to be placing hope in agentic AI as a possible solution to longstanding data challenges. This suggests that for some, agentic AI is not just a next step in data evolution—it's a chance for a strategic reset.

Outlook on Agentic AI by Self-Service BI Adoption

Figure 17 - Outlook on agentic AI by self-service BI adoption

The same dynamic holds true for respondents using generative AI in production. These organizations operate in a fundamentally different landscape than do those still in the planning stages. For them, agentic AI is not just another emerging technology—it represents a logical extension of existing capabilities, rather than a standalone or additive solution. Since most organizations applying genAI to production use cases already have in place related infrastructure, governance models, and user familiarity, they likely view agentic AI as an integrated advancement that builds on their genAI foundation, rather than merely an exciting but separate possibility.

Outlook on Agentic AI by Agentic AI Adoption

Figure 18 - Outlook on agentic AI by agentic AI adoption

Current AI strategy deeply intertwines with several key dimensions—strong leadership, prior success with machine learning, and alignment with business strategy. Organizations that treat AI as a cornerstone of their strategic agenda are far more likely to be proponents and excited early adopters of emerging capabilities like agentic AI. The difference is stark when they're compared to those for whom AI plays only a supporting or experimental role. Companies such as Capital One, Chase, Google, and Amazon, as reflected in public literature, exemplify how embedding AI into the core of business strategy accelerates adoption, drives innovation, and creates competitive advantage.

Outlook on Agentic AI by Current Strategic Role of AI

Figure 19 Outlook on agentic AI by current strategic role of AI

Agentic AI Adoption

Despite growing interest, only 7% of organizations have successfully transitioned from experimentation to production deployment of agentic AI (fig. 20). This figure excludes embedded use cases, illustrating the distinctive adoption path of using vendor-provided functionality in an application or solution context. Although many organizations faced barriers in moving from experimentation to deployment with earlier GenAI efforts, the clarity of use cases and stronger value propositions for agentic AI suggest that history may not repeat itself. Encouragingly, 28% of respondents have advanced from excitement to active experimentation, signaling that a meaningful portion of organizations are dedicating resources to validate and scale this innovation. Together, these two groups represent a clear early majority.

Figure 20 - Agentic AI adoption

Adoption of agentic AI by geography shows meaningful variation (fig. 21). Organizations in North America report the most production use of agentic AI (9%). Latin America and Asia Pacific follow next most often, while EMEA significantly lags (with only 1% indicating production use). These figures mirror broader genAI adoption trends, where Latin America leads in production deployment, followed by Asia Pacific and North America, with EMEA again at the bottom at just 12%. The consistently lower adoption rates in EMEA in part reflect general regulatory caution and a more conservative approach to emerging technologies as European Union AI laws continue to emerge, coalesce, and be implemented. Slower investment cycles may also play a role. Regional maturity, innovation appetite, and risk tolerance continue to shape global adoption patterns for agentic AI.

Agentic AI Adoption by Geography

Figure 21 - Agentic AI adoption by geography

Analyzed by business function, sales and marketing (unsurprisingly) lead the way in adoption of agentic AI, with 14% of organizations having moved to production—reflecting the high demand for personalization, customer engagement, and campaign optimization. IT and operations follow next most often (9%), aligning with the broader enterprise outlook that positions agentic AI as a tool for both front-office innovation and back-office efficiency. This data indicates that agentic AI adoption occurs where measurable value and faster returns are most evident, particularly in functions that benefit from automation, decision support, and data-driven insights.

Figure 22 - Agentic AI adoption by function

Viewed by industry, the highest levels of production deployment of agentic AI occur in technology, where 16% of organizations have moved beyond experimentation. This leadership is expected, given the sector's agility, technical expertise, and culture of rapid innovation. Manufacturing and business services next most often report production use of agentic AI (5% each), respectively leveraging it in their industries to drive automation, quality control, and supply chain optimization, and enhance client delivery and operational efficiency. These trends highlight that early adoption is strongest in industries with both the technical readiness and clear operational use cases to capitalize on agentic AI's capabilities.

Figure 23 - Agentic AI adoption by industry

AI adoption, particularly for agentic AI, closely correlates with an organization's success with BI. Organizations that consider their BI initiatives "completely successful" (the highest level of achievement) account for 10% of those in production with agentic AI, while another 5% come from those that consider their BI efforts somewhat successful. Together, these two groups make up the entirety of current adopters, indicating that a strong data foundation and analytical maturity are prerequisites for effectively operationalizing advanced AI capabilities. This alignment underscores the importance of a well-established BI strategy as a stepping stone for AI-driven transformation.

Figure 24 - Agentic AI adoption by success with BI

Agentic AI Priorities

Where do organizations see the greatest opportunities for agentic AI? Is agentic AI primarily about enhancing productivity, enabling business transformation, or elevating customer experience and decision making? Survey results indicate that it is, in fact, about all of these opportunities. When asked to rate the importance of potential benefits, respondents most often consider improving customer experience and personalization to be critical, followed closely by improved decision making and gains in productivity and efficiency. Interestingly, respondents least often view market and business expansion as critical, suggesting that while agentic AI holds transformational promise, most organizations initially will use it to enhance existing operations rather than drive new growth.

Agentic AI Priorities

Figure 25 - Agentic AI priorities

Examining budget trends reveals a clear relationship between financial commitment and the strategic emphasis placed on agentic AI initiatives. Organizations with decreasing BI budgets most often prioritize productivity and efficiency gains, signaling a need to extract more value from existing resources rather than pursue expansive innovation. This behavior mirrors broader business trends, for which cost containment and operational streamlining take precedence.

Agentic AI Priorities by BI Budget Plans

Figure 26 - Agentic AI priorities by BI budget plans

Conversely, organizations with increasing BI budgets more broadly distribute their priorities. Although they also value productivity improvements, they are far more likely to support agentic AI initiatives that expand innovation, enhance customer experience, and build competitive advantage. This wider distribution suggests these organizations see agentic AI as a transformative lever, not just a tool for efficiency, and are willing to

invest accordingly. In short, spending direction offers a valuable lens for understanding not just what organizations care about—but how committed they are to acting on it.

Organizations that position AI as a cornerstone of their strategic plans are seeking a broader and more immediate range of business benefits. These “cornerstone organizations”—compared with organizations holding all other levels of perception—most often prioritize all areas of leverage/investment/adoption: enhancing decision-making capabilities, elevating customer experience, improving search and discovery functions, fostering creativity, and driving market and business expansion. In contrast, organizations in which AI plays only a minimal strategic role tend to concentrate primarily on improving customer experience. The prioritization of AI-related benefits varies at other levels of strategic integration, reflecting differing levels of organizational commitment and maturity in AI adoption.

Agentic AI Priorities by Current Strategic Plan for AI

Figure 27 - Agentic AI priorities by current strategic plan for AI

Functions Using AI

Correlating functional interest in genAI and agentic AI with stated business priorities can help indicate where momentum is building—and where future adoption may surge. As the more established trend, genAI unsurprisingly more often shows intended use across functions. Despite its newness, agentic AI shows a gap difference range of 3-18 percentage points across all functions, signaling its rising strategic relevance. Unsurprisingly, IT leads all functions in interest (58%), reflecting its role as a primary enabler of technological change. However, operations, marketing, finance, and sales all indicate high levels of expected use (35%-58%)—each recognizing the potential of AI to drive efficiency, personalization, and insight-driven decision making.

Figure 28 - Functions using AI

Interestingly, C-level expected use of agentic AI appears somewhat more tempered at this stage, suggesting that while executive leadership may be monitoring developments,

they have not yet fully prioritized agentic AI as a core driver of transformation. This is likely to shift as agentic AI moves from experimentation to embedded, transformative impact—particularly as early use cases demonstrate measurable business value. As strategic alignment increases, executive-level engagement will accelerate, bringing greater organizational cohesion to AI adoption.

Notable geographic differences are apparent in the expected adoption of agentic AI by business function. Latin America most often shows use of agentic AI in sales and marketing, with 67% of these organizations reporting early adoption in these functions. This suggests strong leverage of AI to enhance customer engagement, drive top-line growth, and create competitive differentiation. Such a high level of functional deployment indicates not only openness to innovation but also a clear intent to use agentic AI as a front-line enabler of commercial outcomes in dynamic markets.

Agentic AI Obstacles

Risks have unquestionably muted the production rollout of genAI, and many of these same concerns apply to agentic AI, which is built on similar foundational technologies. Data security and privacy emerge most often as critical issues, cited by 42% of respondents. While other concerns such as response quality and accuracy, implementation costs, talent shortages, and regulatory compliance rank lower individually, they collectively represent substantial barriers. When aggregated, issues related to data security, privacy, legal and regulatory compliance, ethics, and bias form a formidable cluster of risk factors—clearly indicating that trust and governance remain top priorities for scaling AI adoption.

Agentic AI Obstacles

Figure 29 - Agentic AI obstacles

Training and Development

Training and development for agentic AI clearly matters, with 24% of respondents identifying it as critical and a combined 81% considering it critical, very important, or important. Despite vendor efforts to simplify deployment through integrated, full-stack solutions, organizations still face significant challenges in building internal capabilities to fully leverage these technologies. This signals a clear need for more structured enablement—including targeted upskilling, best practices, and guided implementation—to close the gap between potential and realized value.

Figure 30 - Agentic AI proprietary training

An interesting insight emerges when examining which functions report the highest need for support in implementing agentic AI. Not surprisingly, R&D ranks lowest in viewing training and enablement as critical, likely due to its familiarity with advanced technologies. In contrast, sales and marketing top the list, with 29% identifying training as critical, followed closely by BICC and finance. These functions will require the most handholding to move effectively from initial adoption to tangible value, highlighting the need for tailored onboarding, enablement frameworks, and cross-functional collaboration to ensure successful outcomes.

Figure 31 - Agentic AI proprietary training by geography

The larger the organization and the older the company, the more likely it is to view agentic AI training as critical. This trend also holds true for organizations with greater data maturity—those with a CDO in place or significant experience in data science and machine learning. Among these more advanced organizations, 40% rate training and

development as critical, suggesting that deeper understanding of AI's complexity aligns with a stronger recognition of the need for structured learning and upskilling.

Agentic AI Data Sources

When it comes to driving effective agentic AI outcomes, respondents most often (30%) identify CRM data as critical, underscoring the importance of customer insights in enabling intelligent automation and personalized engagement. This is followed next most often by finance and accounting data (27%), which provides the foundation for risk management, forecasting, and compliance-driven automation. Product data also ranks highly (26%), supporting everything from supply chain optimization to product life cycle management. Together, these data domains reflect the breadth of information required to unlock the full potential of agentic AI across diverse business functions.

Agentic AI Datasources

Figure 32 – Agentic AI data sources

Industry and Vendor Analysis

Industry and Vendor Analysis

As described earlier, agentic AI solutions are built on three foundational capabilities: a clearly defined business process, an LLM, and access to relevant (often cloud-hosted) data. These components work together to enable intelligent task execution—automating actions, making decisions, and adapting in real time with minimal human intervention. The business process at the core of each solution can take the form of a structured, rule-based workflow or a more adaptive business script, depending on the nature of the task. Workflows are ideal for repeatable, high-precision operations, while scripts offer flexibility for more variable or context-sensitive activities (but often require manual updating and management).

Industry Support of Agentic AI Features

In our industry and vendor analysis, we examined the strategies and capabilities of 140 companies that are responding to the growing demands of AI-driven business transformation. Of these, 38 companies directly participated in our research by replying to targeted requests for information. Our assessment of the remainder was based on our ongoing understanding of the market, vendor strategies, and product evolution trends. This blend of direct input and market observation provides a robust perspective on the features and priorities shaping current AI platform strategies.

Figure 33 - Industry support of agentic AI

A striking 68.5% of software vendors are already supporting agentic AI—and most of the rest plan to follow within the next 12 months. This overwhelming alignment signals more than a trend; it marks an industrywide inflection point. As Rita McGrath writes in *Seeing Around Corners*, an inflection point is “a change in the business environment that dramatically shifts some element of a company’s activities, throwing certain taken-for-granted assumptions into question.” That’s exactly what we’re witnessing around AI. Vendors are rethinking their architectures, road maps, and customer commitments in response to the rapidly changing landscape. For business leaders, this isn’t just a signal—it’s a call to act.

When asked why they are prioritizing agentic AI capabilities, vendors revealed a telling hierarchy of motivations. Two-thirds cite market differentiation, future-proofing, customer demand, and competitive necessity as their top drivers—underscoring the urgency to stay ahead or at least at par with peers and meet rising customer expectations. At the same time, 53% pointed to operational imperatives, indicating a clear recognition that foundational changes are needed to ensure their systems and services keep pace with customer expectations.

Figure 34 - Industry drivers for agentic AI

We weighed considering a broad set of capabilities, but instead focused on six core features that repeatedly emerged as critical to enabling enterprise-scale AI initiatives. These features include: data integration or data virtualization, a semantic layer, workflow automation, agent chaining, integration with foundational models, and predictive and proactive systems. Each of these capabilities plays a distinct role in supporting the design and execution of intelligent, agentic workflows and decision-making systems. These findings underscored our observation that platform modernization is not being approached as a one-dimensional technical upgrade. Rather, it has drawn a multifaceted strategic response—balancing near-term competitiveness with long-term resilience and operational necessity. Figure 35 lists the capabilities that vendors feel are needed to deliver an agentic AI solution.

Industry Support of Agentic AI Capabilities

Figure 35 - Industry support of agentic AI capabilities

Agentic AI Vendor Assessment

In this section we review vendors offering agentic AI features and functionality.

In evaluating vendors, we have considered a number of criteria, which were reported by vendors, reconfirmed, and then evaluated by our analysts.

Where vendors did not self-report, our team have assessed functionality based on publicly available information. The latter are identified with an asterisk (*).

We considered five categories for agentic AI and nineteen associated features (table 1).

Table 1 - Agentic AI criteria

Category	Feature
Data Preparation and Analysis	Dataset Preparation & Enrichment
	Data Integration & Orchestration
	Conducting Specific Analyses
	Autonomous Reporting & Visualization
	Semantic Layer Interaction
	Multi-source Synthesis
Operational and Experience Automation	User Guidance & Recommendations
	Proactive System Monitoring
	Personalized UX Adaptation
	Workflow Automation
	Agent Chaining / Multi-Agent Orchestration
	Context Awareness / Memory
Autonomy and Control	Human-in-the-Loop Override
	Goal-Oriented Autonomy
	Decision Transparency
	API & Ecosystem Integration
Integration and Deployment	Deployment Flexibility
	Access Control & Policy Enforcement
Security, Governance, and Risk	Bias & Risk Mitigation

Vendor Assessment by Segment

Agentic AI represents a set of automation capabilities and is not a market. However, these capabilities can be found in products in multiple market segments.

For the purposes of this report, we have grouped vendors into four categories, which, in some cases, combine existing markets.

The four segments that we use include:

1. Data Management, Integration & Infrastructure Tools
2. Data, AI & Analytics Platforms
3. Enterprise Applications, EPM & Industry Solutions
4. Hyperscalers & Cloud Ecosystems

Agentic AI Ratings: Data Management, Integration & Infrastructure Tools

For this segment we evaluate vendors and products that deliver data infrastructure capabilities ranging from data preparation, data integration, data warehousing, data catalog, and master data management (fig. 36). Top ranked vendors include: Databricks (1st), Informatica (2nd), Starburst (3rd), Matillion (4th), Snowflake (4th), and Incorta (5th).

Data Management, Integration & Infrastructure Tools

Figure 36 - Data management, integration & infrastructure tools

* Unconfirmed by vendor

Agentic AI Ratings: Data, AI & Analytics Platforms

For this segment we evaluate vendors and products that deliver tools and platforms for analyzing data. This includes business intelligence, and AI, data science, and machine learning vendors and products (fig. 37). Top vendors include a three-way tie for first place: DataRobot, Domo, and Tellius. Second place vendors include: DataChat, Dataiku, KNIME, and Qlik. Also top ranked are: Vectara (3rd), Zoho (4th), and Sisense (5th).

Figure 37 - Data, AI, & analytics platforms

* Unconfirmed by vendor

Agentic AI Ratings: Enterprise Applications, EPM & Industry Solutions

For this segment we evaluate vendors offering enterprise business solutions, including those for finance organizations (e.g., EPM), ERP, and ESG (fig. 38). Top vendors include Pigment (1st), SAP (1st), Aera (2nd), Vena (2nd), Workiva (3rd), OneStream (4th), Prophix (4th), Infor (5th), and Wolters Kluwer (5th).

Enterprise Applications, EPM & Industry Solutions

Figure 38 - Enterprise applications, EPM & industry solutions

* Unconfirmed by vendor

Agentic AI Ratings: Hyperscalers & Cloud Ecosystems

For this segment we evaluate large software vendors, that cross multiple categories, offering a wide range of products and services – including cloud-based capabilities and associated ecosystems (fig. 39). Top vendors include Palantir (1st), Salesforce (2nd), Oracle (3rd), Boomi (4th), and Microsoft (5th).

Hyperscalers & Cloud Ecosystems

How many employees does your company employ worldwide?

- ☐ 1-100
- ☐ 101-1,000
- ☐ 1,001-2,000

- ☐ 2,001-5,000
- ☐ 5,001-10,000
- ☐ More than 10,000

How integral is AI to your organization's overall business strategy for 2025?

- ☐ AI is a cornerstone, directly driving and shaping the business strategy.
- ☐ AI plays an important role, primarily supporting broader strategic initiatives.
- ☐ AI is in an exploratory phase and has not yet become central to the business strategy.
- ☐ AI has a minimal role or is not currently included in the business strategy.
- ☐ Other - Write In: _____

What is the primary driver for your AI investments in 2025?

- ☐ Anticipating future industry disruption
- ☐ Addressing specific business challenges or inefficiencies
- ☐ Maintaining parity with competitors
- ☐ Experimentation and learning for future use
- ☐ Other - Write In: _____

What strategic business outcomes is your organization aiming to achieve with AI in 2025?

	Critical	Very Important	Important	Somewhat Important	Not Important	Don't Know
--	-----------------	-----------------------	------------------	---------------------------	----------------------	-------------------

Accelerating revenue growth	()	()	()	()	()	()
Gaining competitive market advantage	()	()	()	()	()	()
Enhancing customer experience and satisfaction	()	()	()	()	()	()
Driving operational excellence	()	()	()	()	()	()
Expanding into new markets or products	()	()	()	()	()	()
Enabling data-driven decision-making	()	()	()	()	()	()

How is the coordination and control of AI policies managed within your organization?

() Centralized within an existing data governance, governance-risk-compliance (GRC), or similar framework.

() Centralized specifically for AI initiatives but managed independently of other governance structures.

() Coordinated across separate governance, legal, risk, and compliance functions, with shared accountability.

() Uncoordinated across governance, legal, risk, and compliance functions, leading to potential overlaps or gaps.

() Managed independently at the departmental level, without centralized oversight.

() Unmanaged or handled on an ad hoc basis, with no formal policy in place.

() Other - Write In: _____

How would you describe your organization's AI maturity in 2025?

() Advanced: AI is deeply embedded in core business processes

() Intermediate: AI is used in specific, impactful areas

() Emerging: AI is primarily in pilot or experimental phases

() Nascent: AI is not actively pursued or implemented

() Other - Write In: _____

How closely have you followed news, innovation and advances in generative and agentic AI?

	Constantly	Often	Regularly	Occasionally	Not at all
Generative AI	()	()	()	()	()
Agentic AI	()	()	()	()	()

What is your perspective on Agentic and Generative AI

	We are	Excited	Cautiou	Too	Don't see	Don

	propone nts and actively adopting	about the possibiliti es and will be an early adopter	sly optimisti c and may adopt over time	soon to tell. Will wait and see what happen s.	the value or applicabili ty to our organizati on	't kno w
Generati ve AI	()	()	()	()	()	()
Agentic AI	()	()	()	()	()	()

What are your plans surrounding Generative and Agentic AI if any?

	In productio n today	Experimentin g today	Planne d use in 12 months	Planne d beyond 12 months	No plan s	Don' t kno w
Generativ e AI	()	()	()	()	()	()
Agentic AI	()	()	()	()	()	()

How much budget has been established to support generative or agentic AI projects?

	A substant ial percenta ge of our	A significa nt percenta ge of our	A moderat e percenta ge of our	A small percenta ge of our technolo gy	No budget has been allocated or	Don' t kno w

	technology budget has been allocated or reallocated (greater than 25%)	technology budget has been allocated or reallocated (16%-25%)	technology budget has been allocated or reallocated (Between 5%-15%)	budget has been allocated or reallocated (less than 5%)	reallocated	
Generative AI	()	()	()	()	()	()
Agentic AI	()	()	()	()	()	()

What are your organization's priorities for the leverage/investment/adoption of generative and agentic AI?

More stars = higher priority.

	Generative AI	Agentic AI
Increased productivity / efficiency	_____ _____	_____ _____
Improved decision making	_____ _____	_____ _____
Improved customer experience /	_____ _____	_____ _____

personalization		
Market/business expansion		
Increased creativity		
Improved search quality		

Which functions will be earliest to adopt generative and agentic AI in the short term?

Select all that apply.

	Generative AI	Agentic AI
C-Level Executives	☐	☐
Sales	☐	☐
Marketing	☐	☐
Operations/Production	☐	☐
Finance	☐	☐
Human Resources	☐	☐
IT	☐	☐

What are major issues concerning your organization's adoption of generative and agentic AI?

More stars = larger issue

	Generative AI	Agentic AI
Data security / privacy concerns	_____ _____	_____ _____
Skills / talent availability	_____ _____	_____ _____
Legal and regulatory compliance	_____ _____	_____ _____
Ethics / bias concerns	_____ _____	_____ _____
Costs	_____ _____	_____ _____
Organizational trust / skepticism	_____ _____	_____ _____
Organizational policy	_____ _____	_____ _____

Potential for unintended consequences		
Integration with existing applications, systems, and processes		
Poorly defined use cases		
No quantitative measure(s) of the business value derived from its application		
Quality / accuracy of responses		
Model		

maintenance and management		
----------------------------	--	--

How important is the ability to train generative and agentic AI models with your own data to customize responses and insights?

	Critically Important	Very Important	Important	Somewhat Important	Not Important	Don't know
Generative AI	()	()	()	()	()	()
Agentic AI	()	()	()	()	()	()

Which data sources are important to leverage with generative and agentic AI?

More stars = more important

	Generative AI	Agentic AI
Supply Chain Data		
Finance and Accounting Data		
Call		

Center Data		
Customer (CRM) Data		
Product Data		
Competitive Data		
Documents / unstructured data		
Social media data		
Organizational meta data		

When considering adopting generative or agentic AI capabilities from a vendor, rank these aspects by importance:

	Critically Important	Very Important	Important	Somewhat Important	Not Important
Existing relationship	()	()	()	()	()

Vendor size	()	()	()	()	()
Generative AI capabilities & features	()	()	()	()	()
AI thought leadership	()	()	()	()	()
Other / complementary capabilities & features (not Gen AI)	()	()	()	()	()
Cost	()	()	()	()	()

What large language models do you have a preference for? Check all that apply.

☐ GPT-2

☐ GPT-3

☐ GPT-3.5

☐ GPT-4

☐ GPT-4-turbo

☐ Codex

☐ BERT

☐ LaMDA

☐ PaLM 2

☐ Gemini

☐ T5

☐ RoBERTa

- ☐ LLaMA (Large Language Model Meta AI)
